

## Ask The Tech

In the Ask The Tech Section you will find general advice to help you make better decisions with regard to your heating and air conditioning needs and equipment.

Take me to the "Ask The Tech Section"...

General Cooling Tips:

- Set your thermostat to the highest setting that is comfortable. Do not set the thermostat for your air conditioner any lower than 68°F. Setting the thermostat any lower may "ice" the system, resulting in water leaks, lack of cool air, and incurring unnecessary expense.
- Keep shade and curtains closed as much as possible to keep the indoor air temperature cooler. Your air conditioning unit will work less than it has to keep the temperature down, resulting in lower electricity rates.
- Have your heating and air conditioning system serviced by a professional once or twice per year. This ensures optimum performance, lower utility costs, and longer life expectancy of the equipment. Have A Question?

Fill out our "Ask The Tech" form and we'll be happy to answer any questions you may have.
